## Resolution

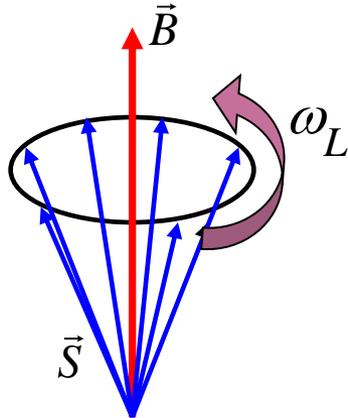

# Magnetic Contrast

How neutrons can visualize magnetic fields?

- Magnetic moment
- Interacts with magnetic fields
- Larmor precession can be used as signal for imaging
- Visualisation of magnetic fields in bulk materials

## Spin precession

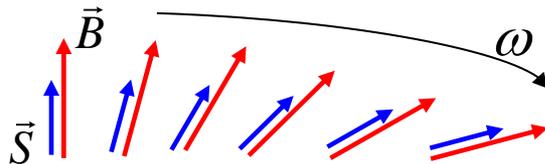

**Larmor frequency:**

$$\omega_L = \gamma B$$

**Gyromagnetic ratio:**

$$\gamma = 1.83 \cdot 10^8 \frac{\text{rad}}{\text{s} \cdot \text{T}}$$

## Adiabatic spin rotation

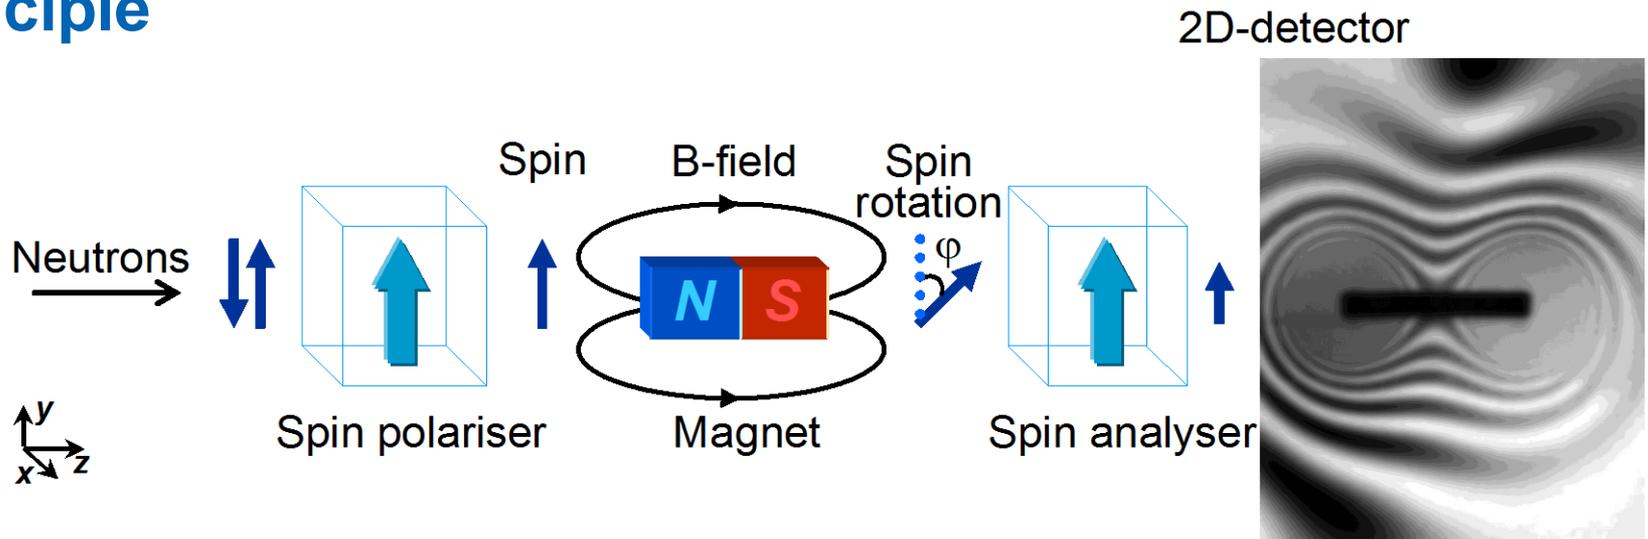

$\vec{B}$  = magnetic flux density

$\vec{S}$  = Spin vector

$$\omega \ll \omega_L$$

# Magnetic Contrast

## Principle

$$I(x, y) = I_0(x, y) \cdot \underbrace{\exp\left[-\int \mu(s) ds\right]}_{\text{attenuation}} \cdot \underbrace{\frac{1}{2}(1 - \cos \varphi(x, y))}_{\text{precession}}$$

## Experimental parameters

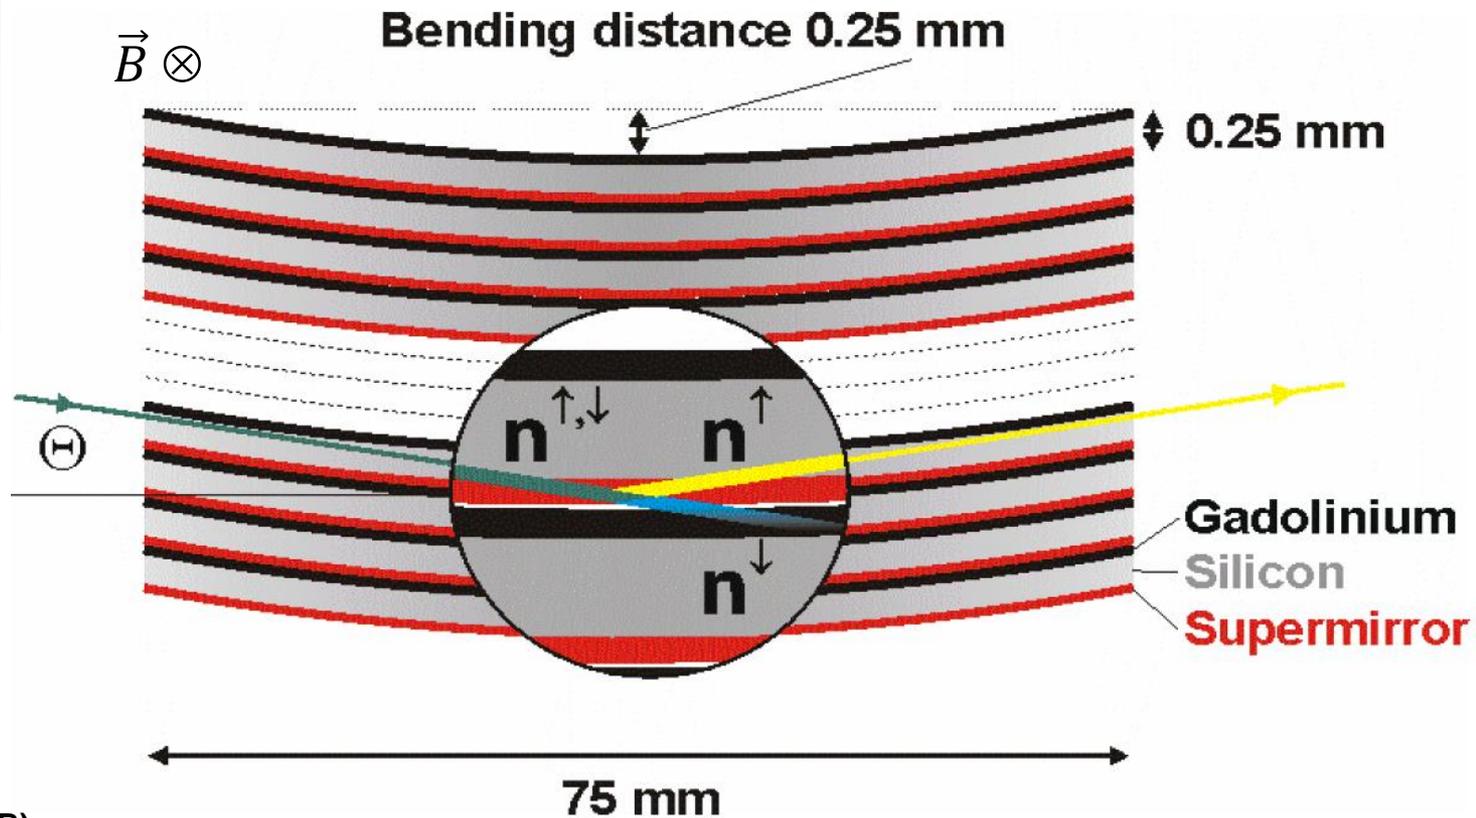

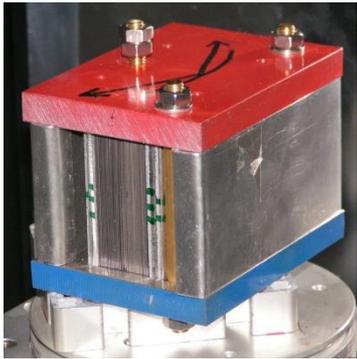

- Solid state polarizing benders
- Beam size (WxH): 20 x 4 cm<sup>2</sup>
- Exposure times: ~10 min / image

$$\varphi = \omega_L t = \frac{\gamma_L}{v} \int_{\text{path}} H ds$$

# Experimental setup

Solid state polariser  
Wavelength optimum  $\lambda = 3.5 \text{ \AA}$

$$\text{Refractive index: } n = 1 - \lambda^2 \left( \frac{N \cdot b_c}{2\pi} \pm \frac{\mu m B}{h^2} \right)$$

Source: Dr. Krist (HZB)

# Experimental setup

## Option with polarized neutrons

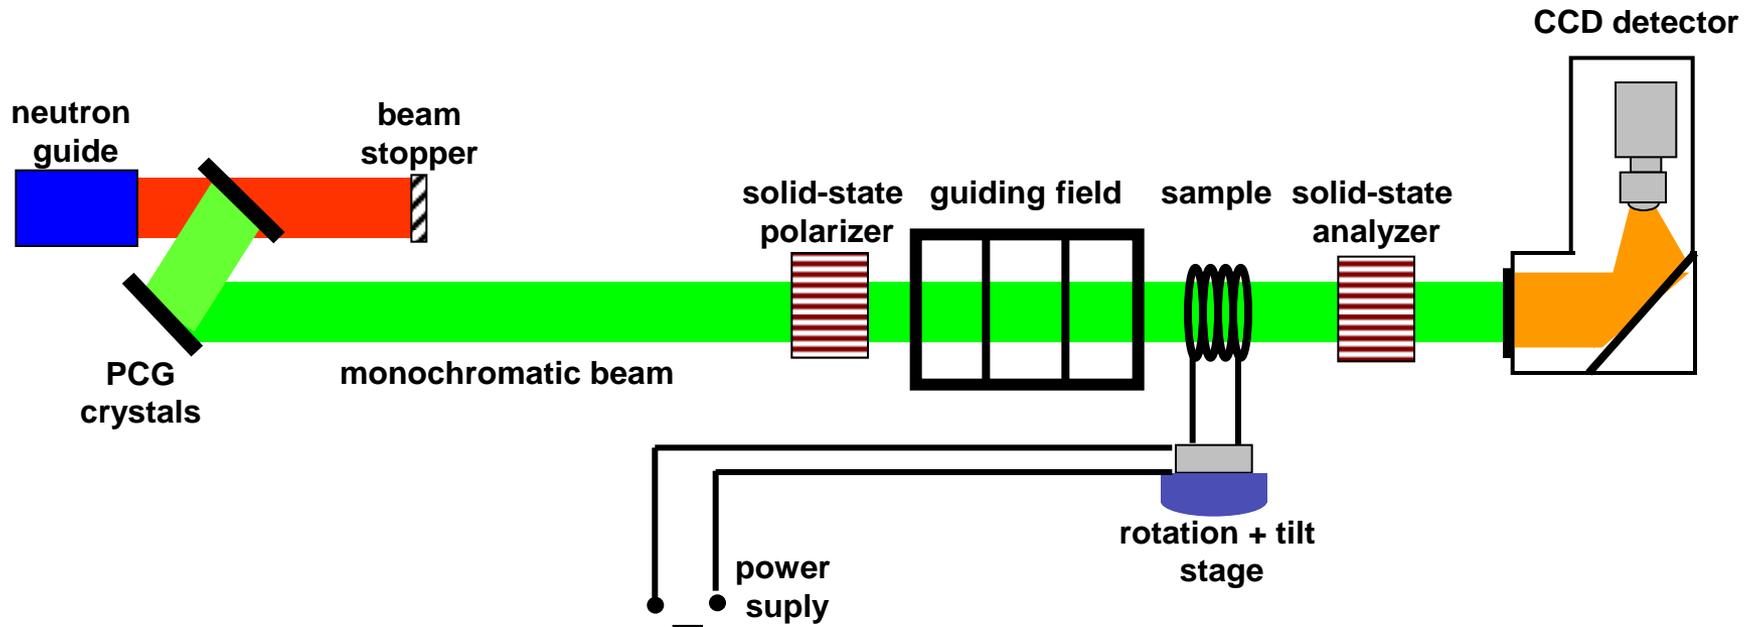

Instrument: V7 (CONRAD) at HMI

Date: 11-15 July 2006

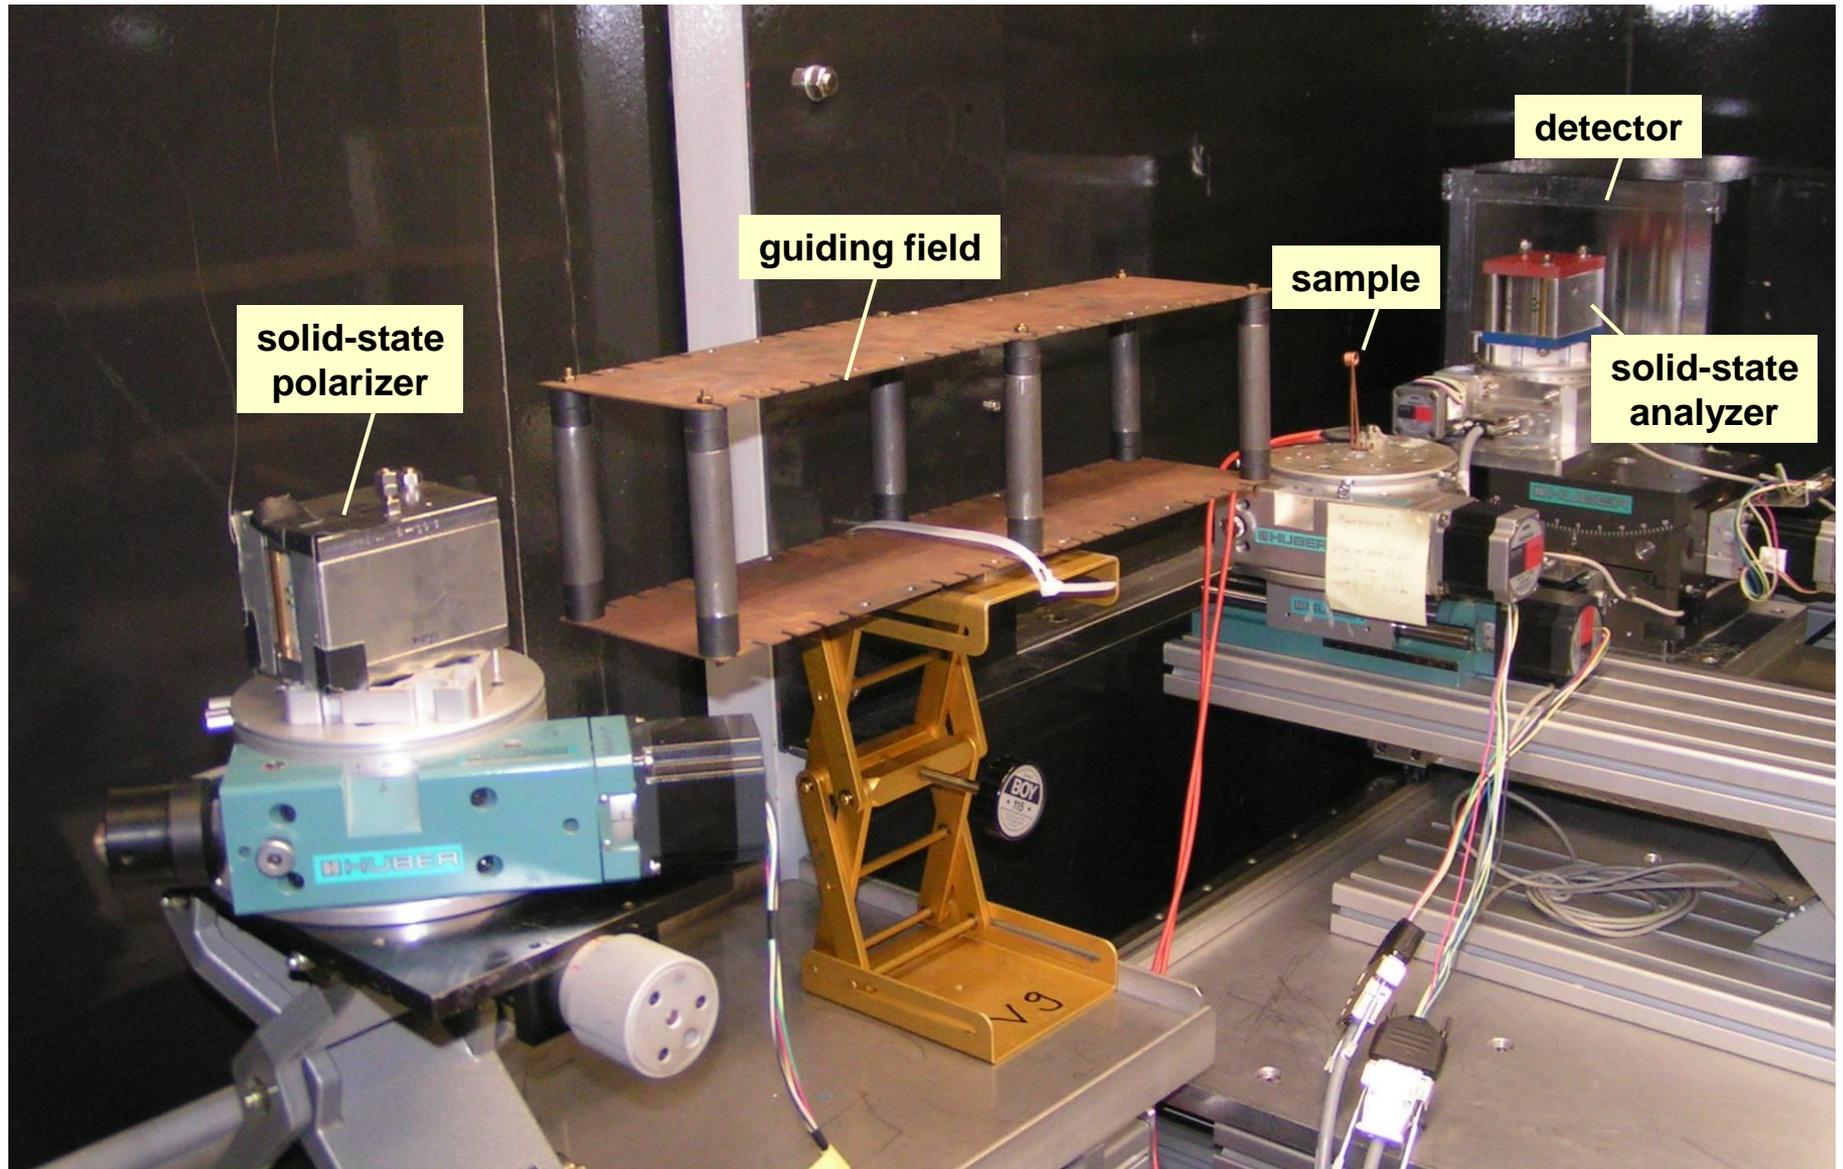

Options: Monochromatic option: 4.2 Å

Detector mode: CCD, low-resolution mode (0.2 mm/pixel)

## Experimental sketch:

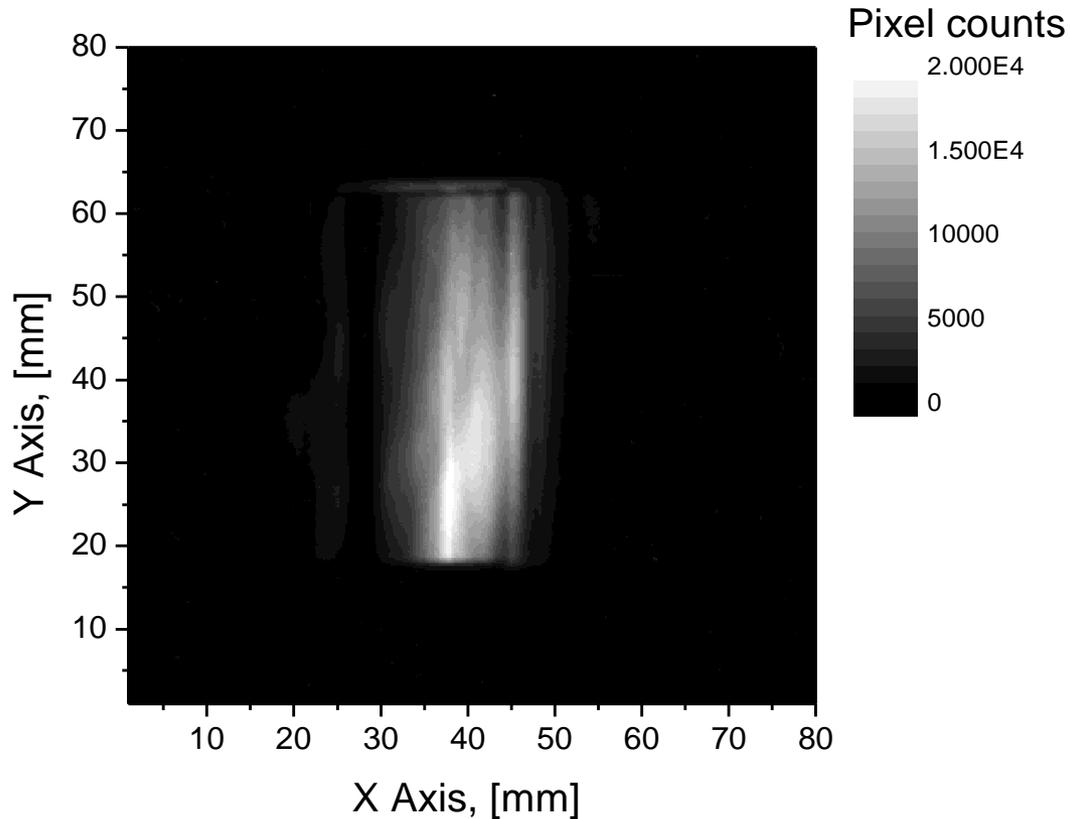

# Experimental setup

# Experimental setup - results

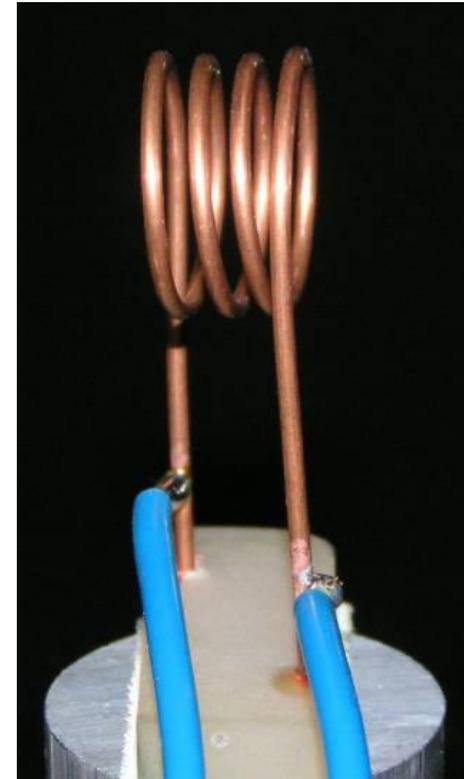

## Experimental parameters

### Open beam

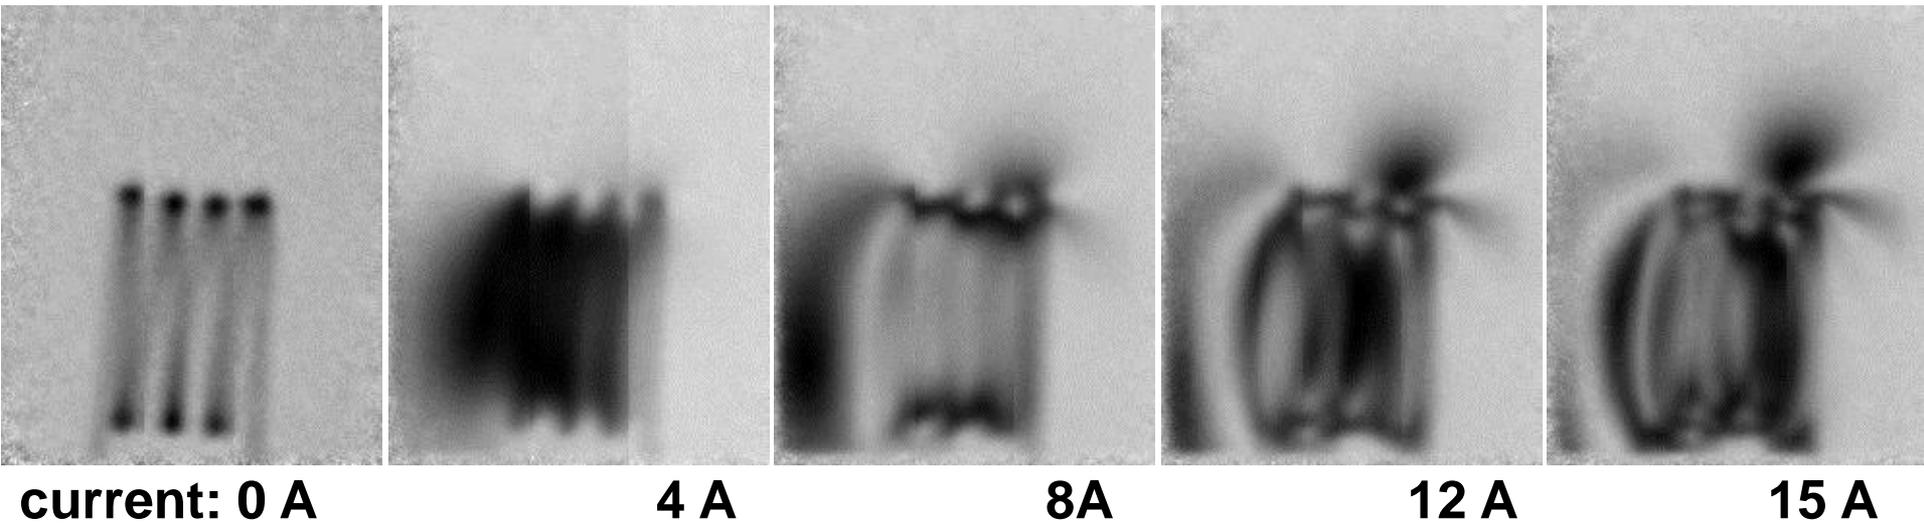

**Exposure time: 300 s**  
**Binning: 2x2**

### Sample

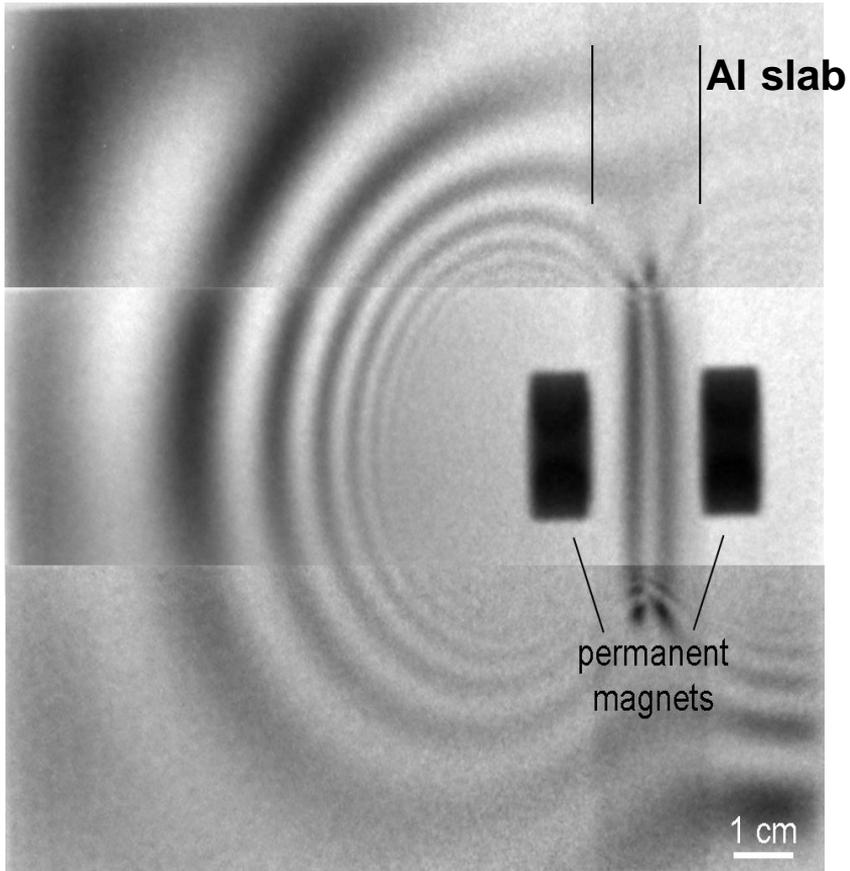

**Copper coil**  
**Wire thickness: 2 mm**

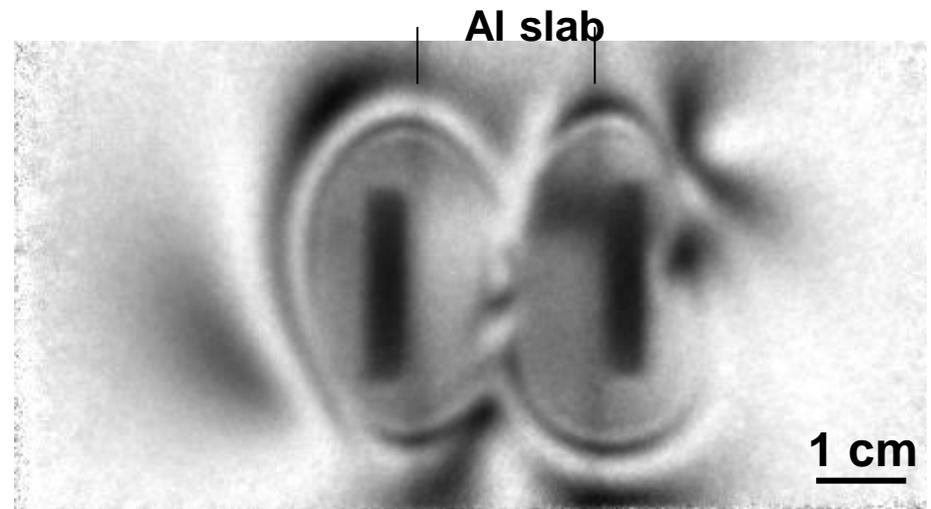

## Results

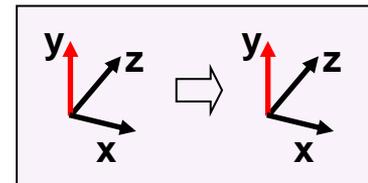

# Experimental setup - results

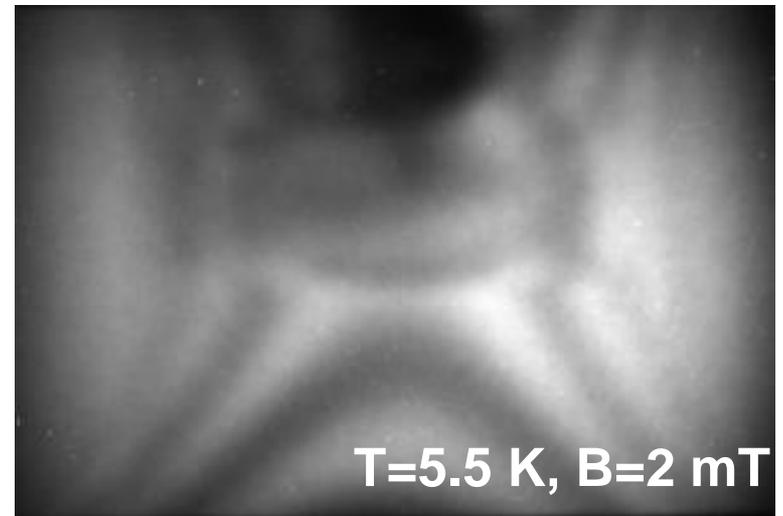

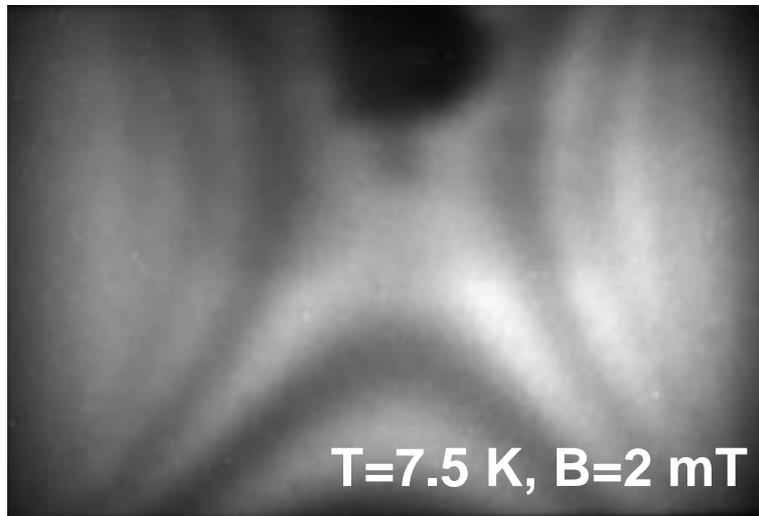

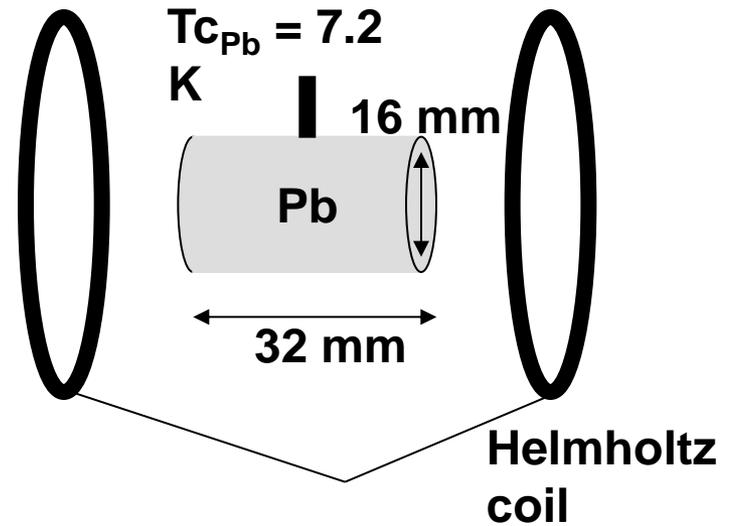

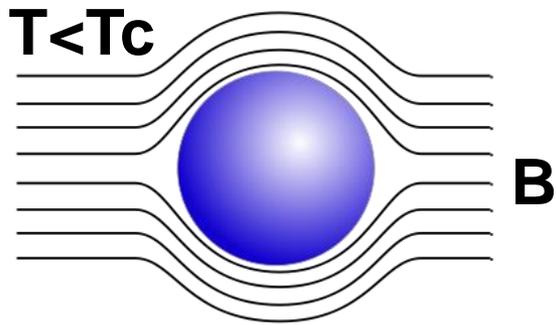

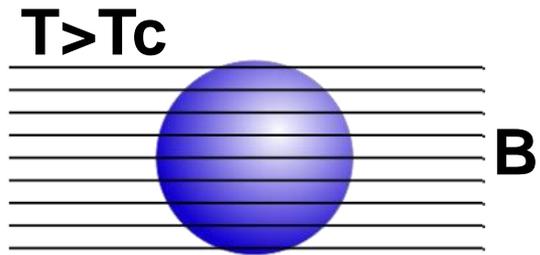

dipole magnets

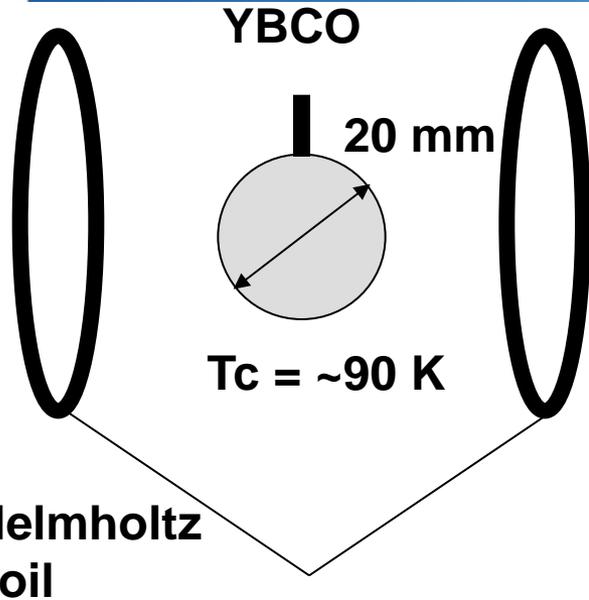

non-dipole magnets

## Flux pinning in superconductors

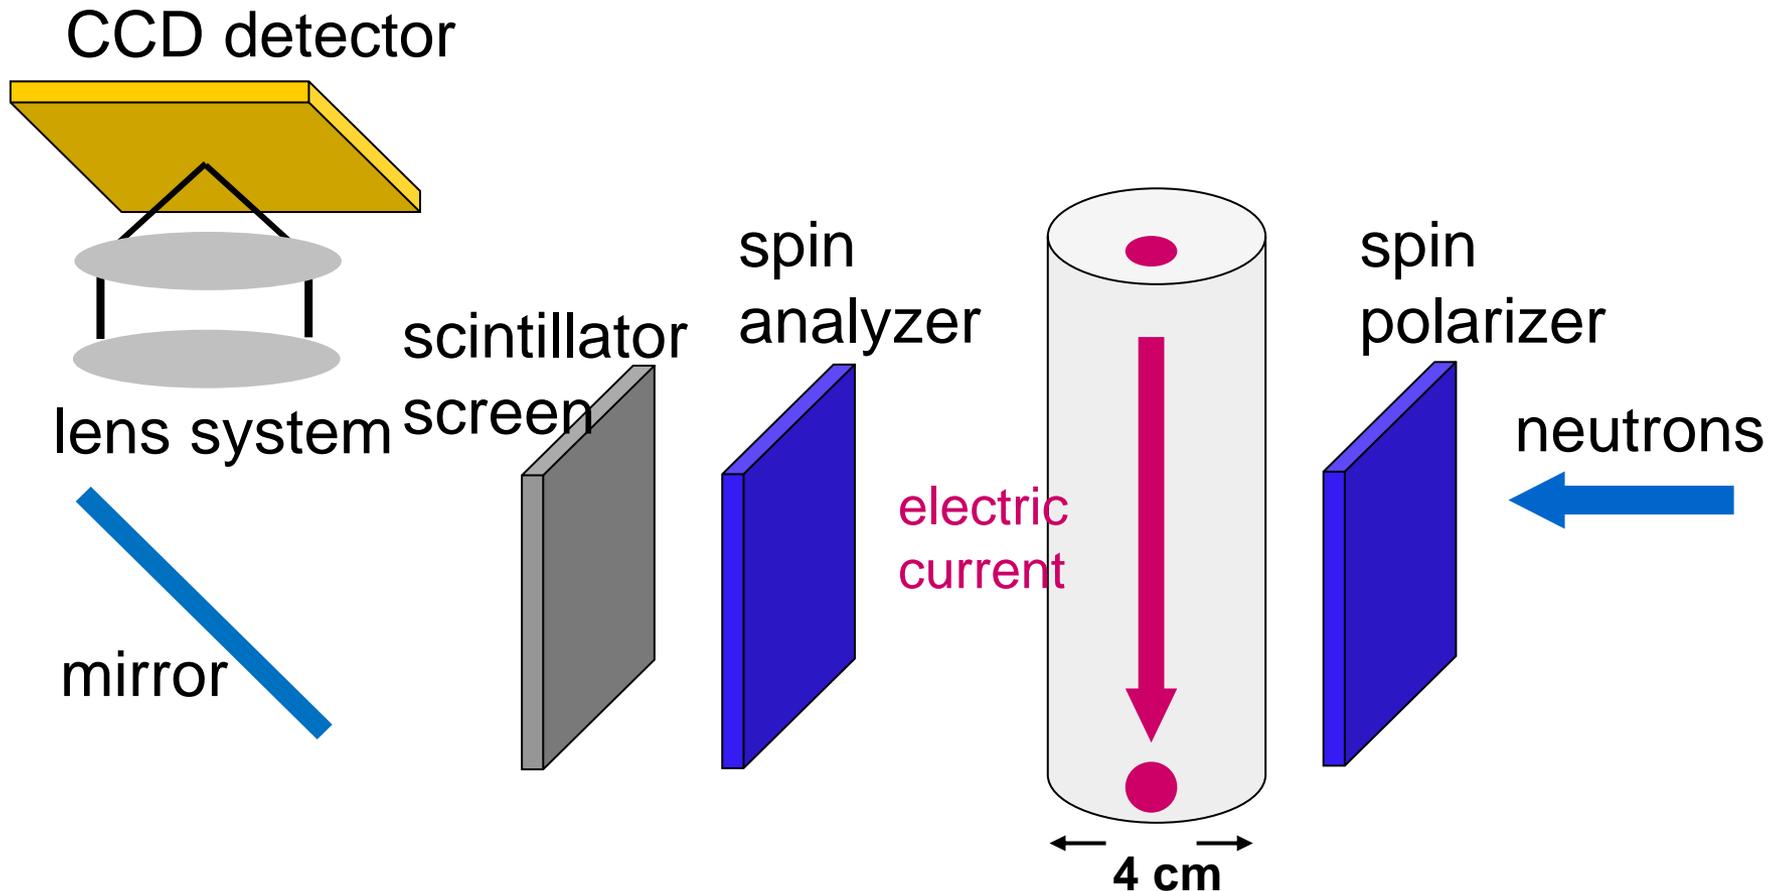

### Tomography

Flux pinning at cooling down below  $T_c$  while applying a homogenous magnetic field of 10 mT perpendicular to the beam.

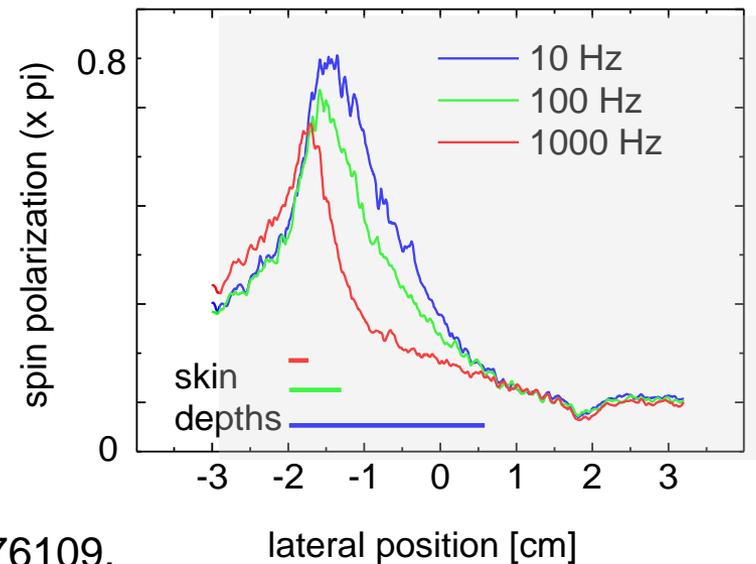

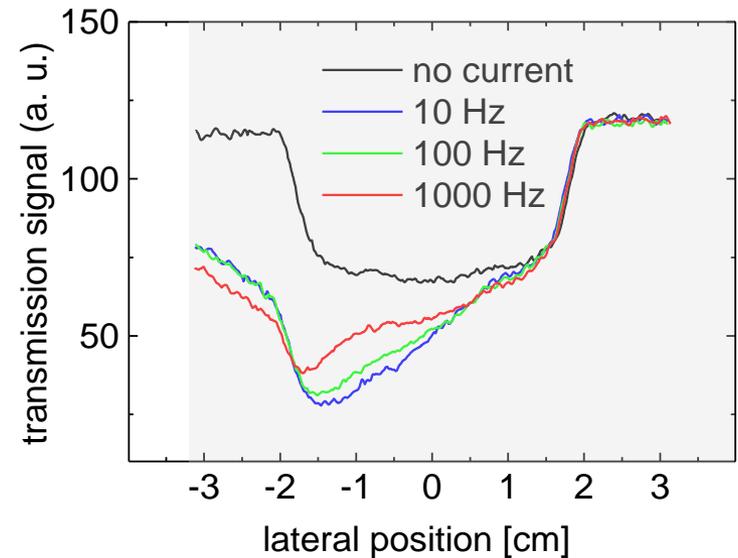

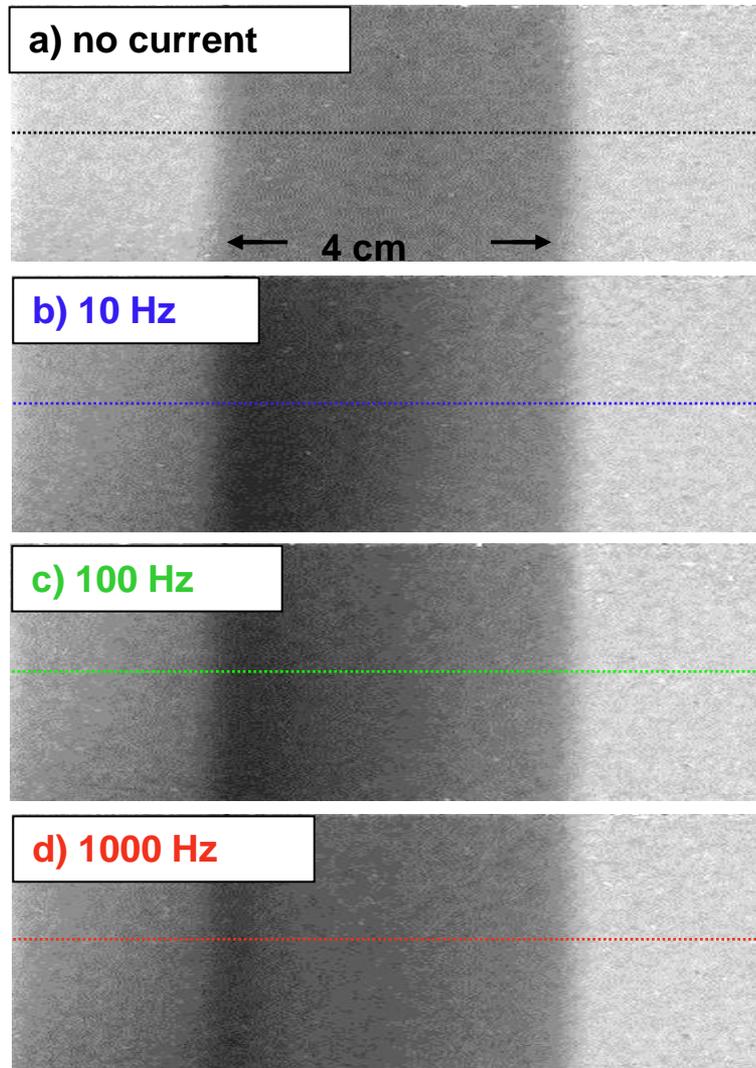

The images were recorded after switching off the magnetic field.

# Application: Skin-Effect

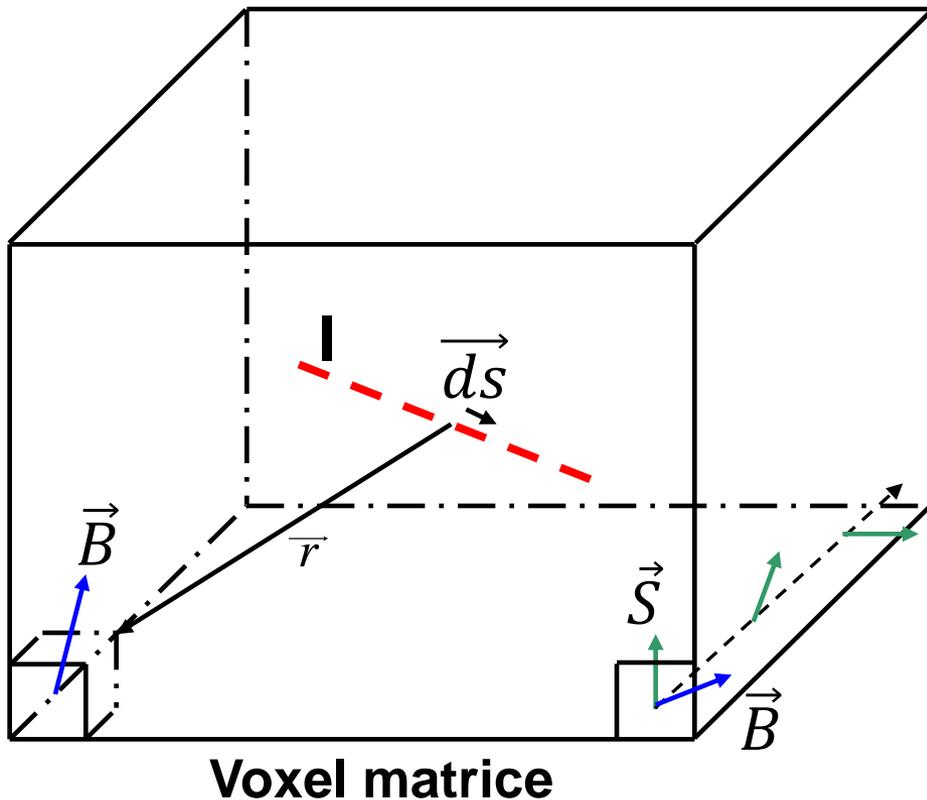

Manke, I., et al. "Investigation of the skin effect in the bulk of electrical conductors with spin-polarized neutron radiography." *Journal of Applied Physics* (2008): 076109.

# Application: Skin-Effect

- Aim: to describe a real experiment by a simulation
  - the magnetic field of a conductor can be describe by using the Biot-Savart's law
  - this is the precondition for the calculation of the spin rotation during the field penetration

# Simulation process

**Biot-Savart's law:**

$$\vec{B}(\vec{s}) = -\frac{\mu_0}{4\pi} \cdot I \cdot \frac{d\vec{s} \times \vec{r}}{r^3}$$

**Larmor precession**

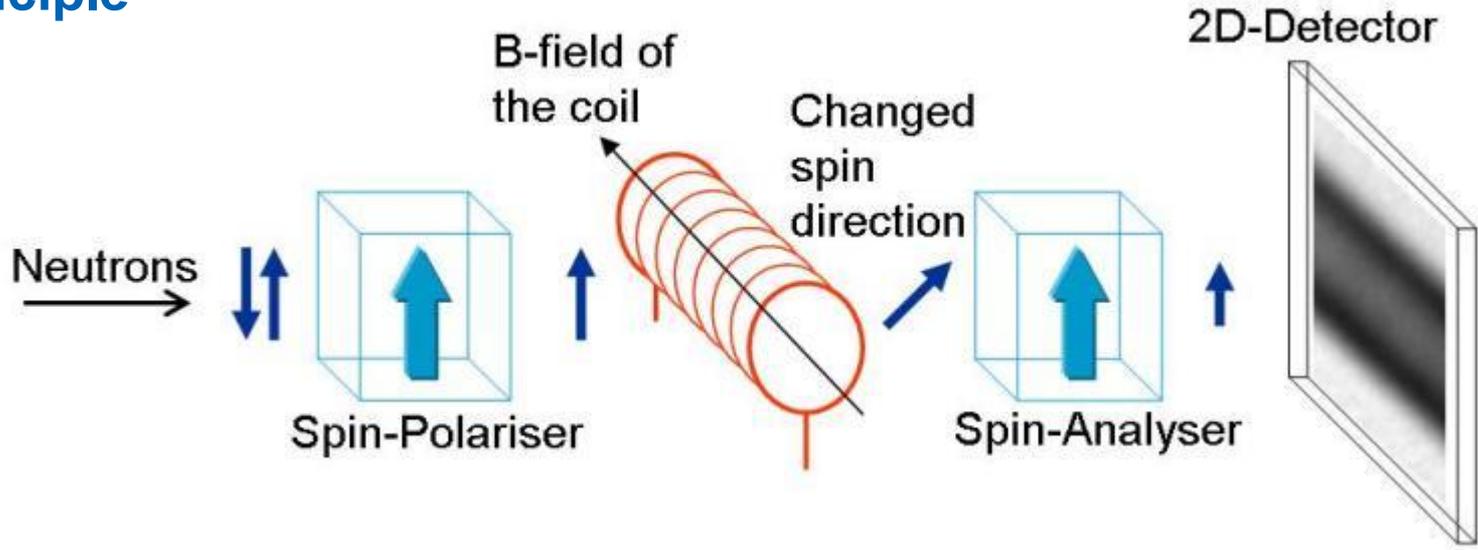

$$\varphi = \gamma \cdot t \cdot B$$

$$\gamma = 1.832 \cdot 10^8 \frac{\text{rad}}{\text{s} \cdot \text{T}}$$

$$t \sim \lambda$$

# Neutron imaging

## Principle

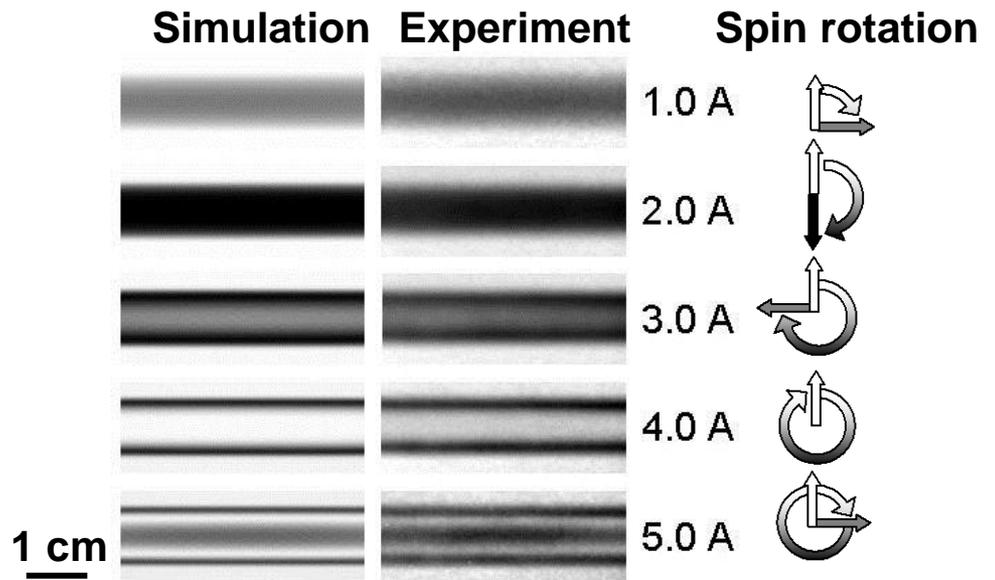

## Biot-Savart law

$$d\vec{B} = \frac{\mu_0}{4\pi} \frac{Id\vec{l} \times \hat{r}}{r^2}$$

## Spin rotation

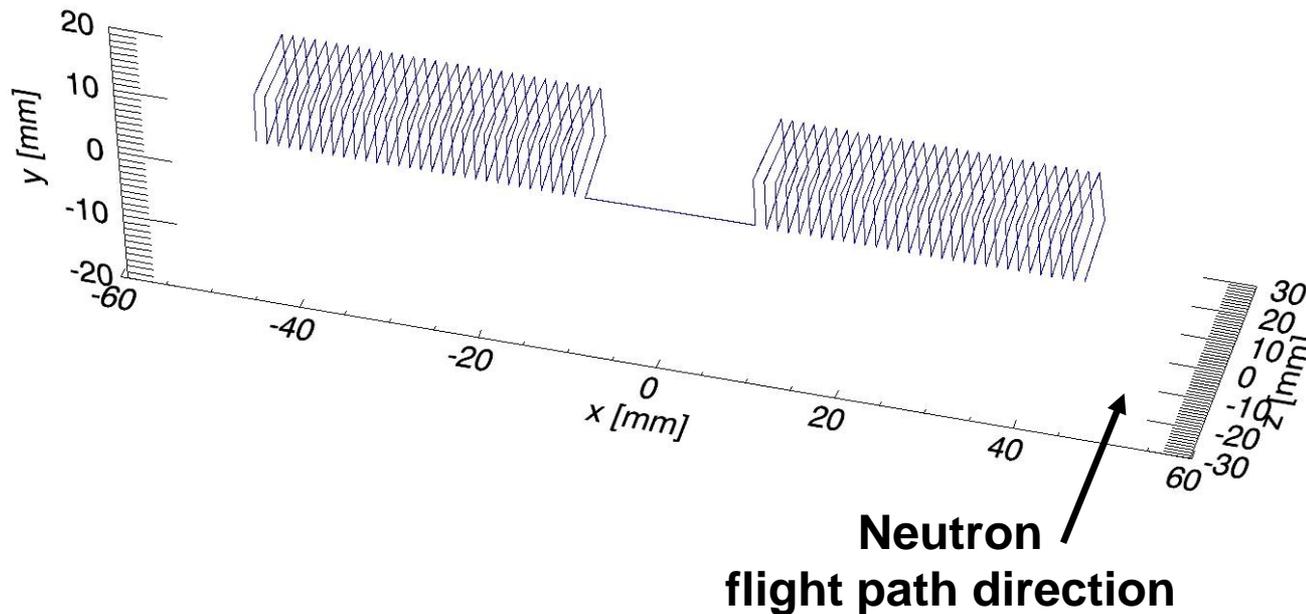

$$\varphi = \frac{\gamma_L}{v} \int_{path} B ds$$

# Simulation process - results

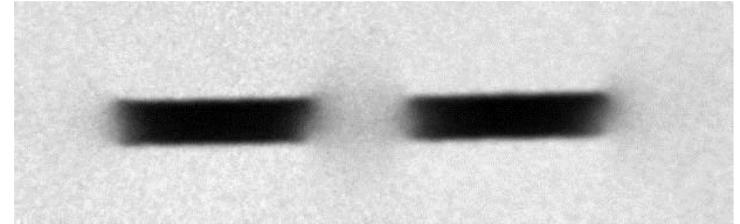

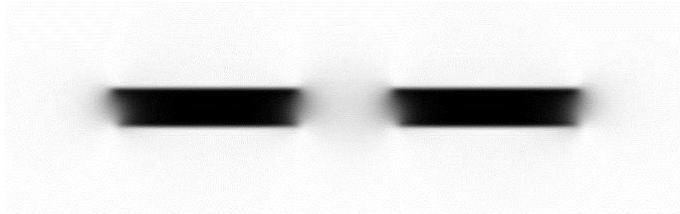

Double rectangle coil

- length = 36 mm
- width = 7 mm
- height = 21 mm
- windings = 30
- distance between the coils = 20 mm
- applied currents = 0.0 – 9.0 A
- field strength  $B = 1.05 \text{ mT} @ I=1\text{A}$
